It will take more work, but you might be able to implement the signal processing in your program. Because the Java Sound API gives you access to the audio data as an array of bytes, you can alter these bytes in any way you choose. If you're processing incoming sound, you can read the bytes from a TargetDataLine and then manipulate them. An algorithmically trivial example that can yield sonically intriguing results is to play a sound backwards by arranging its frames in reverse order.

Processing Audio with Controls (The Java™ Tutorials > Sound)

To use Processing in our Java code, we have to include Processing on our classpath. To set your project's classpath, right-click your project, and then click the Properties option. This brings up a dialog with all the settings you can specify for your project. Click the Java Build Path menu, and then the Libraries tab, which takes you to this screen:
