Abaqus/Standard allows the user to choose between two types of eigenvector normalization: the eigenvectors can be scaled so that the largest entry in each vector is unity, or they can be normalized so that the generalized mass for each vector is unity ($m_{\alpha} = 1$). The choice of eigenvector normalization type does not influence the results of subsequent modal dynamic steps.

Abstract A new method for the modal characterisation of rotating machinery structures is presented. The method accounts for the effects of gyroscopic and other forces related to rotation, which are associated with the asymmetry of the damping and stiffness matrices of rotating machinery.

The equation of motion for a one degree of freedom system (one of the eigenmodes of the system) is. $m\ddot{q}+c\dot{q}+kq=0$, $m\ddot{q} + c\dot{q} + k\cdot q = 0$, where m is the mass, c the damping, k the stiffness, and q the modal amplitude.
