SYLLABUS - MATH 5593: Linear Programming

Linear programming is the process of taking various linear inequalities relating to some situation, and finding the "best" value obtainable under those conditions. A typical example would be taking the limitations of materials and labor, and then determining the "best" production levels for maximal profits under those conditions.

 Answer: The statement is true. To see why, it is sufficient to observe that for any two optimal solutions x and y , every point $z = x + (1 - \lambda)y$ in between ($0 < \lambda < 1$) has the same objective value $c^T z = c^T x + (1 - \lambda)c^T y = +$

Reformulate it as a linear problem.
 Solution: This is Exercise 1.4 on page 34 in the textbook. The given constraints can be formulated as follows: $a + b \leq 25$ and $a + b \leq 25$ and $a + b \leq 25$ and $a + b \leq 25$:
 (1) We introduce new variable c to represent the optimal cost. With this, the given optimization problem is equivalent to the linear programming problem

A major focus is on applications of linear programming, both in practice and in theory. The book is concise, but at the same time, the main results are covered with complete proofs and in sufficient detail, ready for presentation in class. The book does not require more prerequisites than basic linear algebra, which is summarized in an appendix.
