Abstract. Unwanted vibrations are a common occurrence within structures and systems, and often pose a threat to their integrity or functionality. This research aims to seek a solution to attenuate the vibrations experienced within a

link of a system using active vibration control with piezoelectric patches as actuators, whilst avoiding the use of large and expensive equipment which would contravene with the common objective of maintaining the smallest mass possible of the system.

Active vibration control using piezoelectric actuators ...

The vibration suppression performances of the controller are 5.7 dB and 10.8 dB for the simply-supported plate with/without the mass subject to a chirp sine excitation, respectively. For the experiment of the curved panel subject to a sinusoidal excitation, the vibration attenuation of the

control scheme is 5.0 dB even the control circuit is subject to some noise generated by electrical and magnetic interferences.

Abstract. The active elasticity control of a piezoelectric actuators connected to the negative capacitance

(NC) circuits represents an efficient tool for the suppression of vibrations in mechanical structures. In this paper, the authors study theoretically and experimentally the vibration transmission through a piezoelectric bimorph connected to the NC circuit.

Vibration control using piezoelectric bimorphs connected ...

Active vibration control is one of the best approaches to suppress vibration. One of the methods of active control is using piezoelectrics as actuators [1]. It is worth noting that piezoelectric is the coupling of structural and electric Computer Aided Optimum Design in Engineering X 199
