Abstract. AASHTO's practice for designing flexible pavements requires resilient modulus of the subgrade soils. The resilient characteristics are assumed to account for the permanent deformations of soils. However, this approach can provide misleading characterizations. PERMANENT DEFORMATION CHARACTERISTICS OF SUBGRADE SOILS ...

Coarse grained soils, which are generally the main construction materials of subgrade layer in railway system, usually present two types of deformation behavior when subjected to repeated traffic-type dynamic load: (a) resilient or recoverable deformation, which is related to the load-carrying ability of track structure, reflects stiffness properties of the material and (b) residual or irreversible deformation, which contributes to most of the subgrade settlement, determines long-term ...

It can be seen that in case of subgrade soil as well as mixed material the M R value increases with the increase in deviatoric stress and bulk stress. The reason is that increase in deviatoric stress causes reorientation (not like cohesive fine grain soil which shows shear deformation known as softening effect) of granular

aggregate letting more compaction, also known as hardening effect.
