The discharge from a spring is to be measured with a 90° V-notch weir. If the head observed on the weir is 5 cm., what is the theoretical discharge and actual discharge?

The opening to this weir is a 90 degree triangular notch. The bottom of the notch is the lowest point with the sides going up at 45 degree angles. The water before the weir should be held in a relatively calm and smooth pool. There should be air underneath the water leaving the weir.

Partially contracted weirs use a different graph for C which is a function of h/P and P/B and is only valid for a notch angle of 90 o. In the graph (not shown - see USBR, 1997), C varies from 0.576 to 0.6; whereas, for a fully contracted 90 o notch, C is 0.578 from our graph shown above. Our

calculation does not account for partially contracted weirs, but for most practical purposes the difference in C is inconsequential.

PROCEDURE: 1. Attach the triangular (90°) v-notch weir, where $\theta=0.5(90^\circ)=45^\circ$ to the channel by-pass valve should always be open. 2. Close the pump flow control valve and start the pump 3.

Fully Contracted, 90 Degree, V Notch Weir Equation The equation recommended by the Bureau of Reclamation in their _Water Measurement Manual,_for use with a fully contracted, 90o, v notch, sharp crested weir with free flow conditions and 0.2 ft < H < 1.25 ft, is: $Q = 2.49H^{2.48}$, where Q is discharge in cfs and H is head over the weir in ft.

Using the water surface elevation and the weir dimensions, equation 4.4 can be used to estimate the discharge for a 90° V-notch compound weir, as performed in example 4.3. A circular weir also measures both small and large discharge but is less accurate at large discharge than the other methods listed in table 4.2.

Since the 90 V-notch was shown to be the most accurate triangular weir over a wide range of discharges (7), a large portion of this work utilized 90 V-notch weirs for low flow rates. Formulas were developed by Lenz (8) for liquids of varying viscosities.

The triangular or V-notch, thin-plate weir is an accurate flow measuring device particularly suited for small flows. For a triangular or v-notch weir the flow rate can be expressed as: $q = 8/15 \times C \times d \times (2g)^{1/2} \times \tan(\theta/2) \times h^{5/2}$ (2) where. $\theta = v$ -notch angle. Broad-Crested Weir. For the broad-crested weir the flow rate can be expressed as:

Triangular or V-notch thin plate weir are used in low discharge streams (Figure 6). Since the area of notch is small in comparison with the cross sectional area of the channel, water is pooled upstream from the weir. As a result, the approach velocity is usually low and the velocity head can be neglected for 90° V notch weir ($\alpha = 90^\circ$).

Thin Plate Weir Stage Discharge Relationships

Only the 90-degree V-notch weir can be made partially contracted through the use of figure 7-7. (b) The water surface downstream from the weir should always remain at least 0.2 ft below the notch. Lower discharge readings should be rejected if the contraction is not springing underneath for the entire nappe length.

USBR Water Measurement Manual - Chapter 7 - WEIRS, Section ...

For a V notch weir with a notch angle other than 90 degrees, the equation for calculation of the flow rate over the weir is given by the equation: $Q = 4.28 C_e \tan(\theta/2) (H + k)^{5/2}$, where the effective discharge coefficient, C_e , and the head correction factor, k, are both functions of the notch angle, θ .

Open Channel Flow Measurement/V Notch Weir Calculations ...

For V-notch weirs, full contraction is produced when the distance b from each side of the weir notch to each side of the weir pool is greater than 2H. For a 90° V-notch weir, the flow width at head level is equal to 2H. Therefore, the weir may be considered to be fully contracted when the ratio $B/H > 6$, i.e., when $H/B < 0.167$.

However, an equation has been developed on the basis of limited laboratory tests on a 1-ft-deep, 90-degree V-notch cut into rectangular notches 2, 4, and 6 ft wide to produce horizontal extensions of $L=0$, $L=2$, and $L=4$ ft, respectively (Bergmann, 1963). The weirs were fully contracted, and heads up to 2.8 ft above the notch point were used.

Discharge rates for the 90-degree V-notch weir (when the head is measured at the weir plate) are included in Table O-2. Flow rates for 60- and 90-degree V-notch weirs can be determined from the

graph in Figure O-3. Minimum and maximum recommended flow rates for Cipolletti weirs are provided in Table O-3.
