Foveated imaging using a liquid crystal lens - ScienceDirect

The liquid crystal lens is driven by a frequency of the voltages different in positive and negative lens states to obtain its largest optical power in each state. An obvious increase in focus range is realised.

Driving method for liquid crystal lens to increase focus range

In this paper, we develop a method to prepare a liquid crystal (LC) lens using photoalignment technology. It's

fabricated by utilizing variable pretilt angles of a photoalignment layer. By irradiating a Gaussian profile laser beam on a photoalignment layer, variable angles from 1° to 89° are formed.

To achieve smooth varifocal, we address the full stack of liquid crystal lenses, with each additional pair doubling the number of focal planes.
