For linear spatial models, statistics on linear-quadratic forms are the basis of spatial econometrics. For nonlinear spatial models, near-epoch dependent random fields play a crucial role. We summarize some important properties of near-epoch dependent random fields and illustrate how they are used in studying nonlinear spatial models such as spatial Tobit and spatial binary choice models.

Spatial econometrics solves these problems by deriving estimators assuming that functional forms are known and by using model comparison techniques to let the data choose between competing specifications. We argue that in most situations of interest this, at best, achieves only very weak identification.

Mostly Pointless Spatial Econometrics?

The Journal of Spatial Econometrics publishes high-quality articles addressing all aspects of spatial and network econometrics, interpreted in a broad sense. The contents include both models and theoretical instruments from spatial statistics and spatial data analysis that describe various economic effects - externalities, interactions, spatial concentration and many others - as they manifest themselves in different areas including economics, geography and regional science.
