The theory of special relativity plays an important role in the modern theory of classical electromagnetism. First of all, it gives formulas for how electromagnetic objects, in particular the electric and magnetic fields, are altered under a Lorentz transformation from one inertial frame of reference to another. Secondly, it sheds light on the relationship between electricity and magnetism, showing that frame of reference determines if an observation follows electrostatic or magnetic laws. Third

The other major conceptual advance in electromagnetic theory was the special theory of relativity. In Maxwell's time, a mechanistic view of the universe held sway. Sound was interpreted as an undulatory motion of the air, while light and other electromagnetic waves were regarded as undulatory motions of an intangible medium called ether.

Relativity: An Alternative ...

Classical electromagnetism or classical electrodynamics is a branch of theoretical physics that studies the interactions between electric charges and currents using an extension of the classical Newtonian model. The theory provides a description of electromagnetic phenomena whenever the relevant length scales and field strengths are large enough that quantum mechanical effects are negligible. For small distances and low field strengths, such interactions are better described by quantum electrodynamics.

Classical electromagnetism - Wikipedia

The reason is that relativity had to be invented to account for the theory of electromagnetic fields and waves in particular. The two go together. Maxwell's equations are the cause of the replacement of the old physics of absolute time by the new view of time as an additional dimension. The problem is that Maxwell's equations predict that

light is an electromagnetic wave travelling at a speed c , i.e. the speed of light. This would be fine if the equations also included the speed that the ...

Special Relativity and Classical Field Theory

In physics, the special theory of relativity, or special relativity for short, is a scientific theory regarding the relationship between space and time. In Albert Einstein's original treatment, the theory is based on two postulates: The laws of physics are invariant in all inertial frames of reference. The speed of light in vacuum is the same for all observers, regardless of the motion of the light source or observer. Albert Einstein around 1905, the year his "Annus Mirabilis papers" were published.
