Scheduling Of Railway Infrastructure Maintenance

Abstract. Condition based maintenance scheduling is a promising approach towards effective track possession management in railway transport. If the maintenance tasks arising from condition monitoring and inspection of railways are efficiently scheduled, high service quality and capacity would be assured.

Hence, the scheduling of major possessions is a key planning problem regarding railway infrastructure maintenance since it (i) has a fundamental impact on the traïfc capacity, (ii) frames the work planning and cost conditions, and (iii) is conducted all the way from freight corridor to timetable revision planning.

In the actual train timetable possible possession allocations are scheduled for maintenance so that it should not affect too much the regular train service. Many countries use timetabling software (e.g. Viriato (6), Opentrack (7)) for finding free intervals or periods with less impact to the train operators.

Scheduling Preventive Railway Maintenance Activities

Abstract. An important aspect of infrastructure management is the scheduling of maintenance tasks, which implies the allocation of tasks to different crews or machines and the determination of an execution order. To this end, different aspects have to be

considered. On the one hand, the maintenance operator is interested in reducing direct maintenance costs, e.g. travel costs.

Abstract. Before railway track maintenance crews can undertake any work, the allocation of activities to available time intervals in the train schedule as well as to crews must be undertaken. This paper puts forward a model aimed at determining the best allocation of maintenance activities and crews so as to minimise the disruption to and from scheduled trains and to reduce completion time.

Abstract. This work addresses a tactical railway traffic scheduling problem focused on the optimization of train sequencing and routing decisions and timing decisions related to short-term maintenance works in a railway network subject to disturbed process times. This is modeled as a mixed-integer linear programming formulation in which the

traffic flow and track maintenance variables, constraints and objectives are integrated under a stochastic environment.

The pressing necessity to renew infrastructure assets in developed railway systems leads to an increased number of activities to be scheduled annually. Scheduling of renewal activities for a railway network is a critical task because these activities often require a significant amount of time and create a capacity conflict in operation scheduling. This paper discusses economic and technological aspects, opportunities, and constraints in the renewals of multiple rail

Railway infrastructure includes railway lines and other structures, buildings and equipment, together with the corresponding land, located on railway premises, designed for the management, passenger or freight transport, and for the maintenance of the infrastructure manager's property for these purposes.
