Lagrange multiplier methods involve the modification of the objective function through the addition of terms that describe the constraints. The objective function  $J = f(x)$  is augmented by the constraint

equations through a set of non-negative multiplicative Lagrange multipliers,  $\lambda_j \geq 0$ . The augmented objective function,  $J_A(x)$ , is a function of the design

In mathematical  
optimization, the  
method of Lagrange  
multipliers is a strategy  
for finding the local  
maxima and minima of  
a function subject to  
equality constraints  
(i.e., subject to the  
condition that one or  
more equations have  
to be satisfied exactly  
by the chosen values  
of the variables). It is  
named after the  
mathematician Joseph-  
Louis Lagrange.

I also tried the method of lagrange multipliers, but the substitutions don't easily result in an easy solution. It requires solving five

equations for five variables, and no easy way to isolate variables. I think the hint is pointing at the fact the domain is a circle of radius 1 centered at the origin.

Each set of solutions will have one lambda. That is, if you are trying to find extrema for  $f(x,y)$  under the constraint  $g(x,y) = b$ , you will get a set of points  $(x_1, y_1)$ ,  $(x_2, y_2)$ , etc that represent local mins and maxs. At each of these, there will be a single lambda.
