Let c be the number of internal end points labeled A. If we count A end points segment by segment we get 2c+1. Therefore 2a+b=2c+1, which implies that b=2 (c-a)+1 so b, the number of segments labeled AB, is an odd number. Since zero is not an odd number there has to be at least one segment labeled AB.

I bought Schaum's Outline of Introductory Mathematical Economics from Amazon, and so far, have found it more helpful in understanding Mathematical Economics than Klein's book. This book would probably be suitable for graduate students that have already obtained sufficient knowledge and proficiency from previous economics and math courses.
