Truss Problems With
Solutions

The method used to solve truss problems is to: Find the forces at the supports by using force and moment equations with given external forces. Calculate the internal forces of beams connected to a

support, keeping in mind which are in compression and which are in tension.

Recall that only two equilibrium equations can be written $\sum F_x = 0$ and $\sum F_y = 0$ This means that to solve completely for the forces acting on a joint, we must select a joint with no more than two unknown forces involved. This can be started by selecting a joint acted on by only two members.
