NLP deep learning architectures usually start with an embedding layer that converts One hot encoded words to numerical vector representation. We can train the embedding layer from scratch but we can also use pre-trained word vectors like Word2Vec, FastText or Glove that were trained on tons of data using unsupervised learning methods or train on data from our domain.

Training deep learning models for NLP tasks typically requires many

hours or days to complete on a single GPU. In this post, we leverage Determined's distributed training capability to reduce BERT for SQuAD model training from hours to minutes, without sacrificing model accuracy. In this 2-part blog series, we outline tips and tricks to accelerate NLP deep learning model training across multiple GPUs, taking BERT for SQuAD model training time down from nearly 7 hours to under an hour.

PyTorch has been an awesome deep learning framework that I have been working with. However, when it comes to NLP somehow I could not find as good utility library like torchvision. Turns out PyTorch has this torchtext, which, in my opinion, lack of examples on how to use it and the documentation can be improved.
