Find a) Period b) Tangential velocity c) Angular velocity of the object. a) If the object does 4 rotation in one second, its frequency becomes; $f=4\text{s}^{-1}$ $T=1/f=1/4\text{s}$ b) Tangential velocity of the object; $V=2\pi r f$ $r V=2\pi r f$

Rotational Motion Exam1 and Problem Solutions

The kinematics of rotational motion describes the relationships between the angle of rotation, angular velocity, angular acceleration, and time. It only describes motion—it does not include any forces or masses that may affect rotation (these are part of dynamics). Recall the kinematics equation for linear motion: $v = v_0 + a t$ (constant a).

Examine the situation to determine that rotational kinematics (rotational motion) is involved. Rotation must be involved, but without the need to consider forces or masses that affect the motion. Identify exactly what needs to be determined in the problem (identify the unknowns). A sketch of the situation is useful. Make a list of what is given or can be inferred from the problem as stated (identify the knowns).

Rotational Kinematics - Practice - The Physics Hypertextbook

On the translational side, replace acceleration with an equation of motion that can be used to find time. On the rotational side, replace angular acceleration with an equation of motion that uses time. Now, combine the two formulas by substituting T from the translational equation into T in the rotational equation, then watch stuff drop out.

Circular and Rotational Motion - AP Physics 1

- The equations for rotational motion with constant angular acceleration have the same form as those for linear motion with constant acceleration.
- Torque is the product of force and lever arm.
- The rotational inertia depends not only on the mass of an object but also on the way its mass is distributed around the axis of rotation.
