Genetic Diversity In European Populations

A similar study in 2007 using samples predominantly from Europe found that the most important genetic

differentiation in Europe occurs on a line from the north to the south-east (northern Europe to the Balkans), with another east-west axis of differentiation across Europe. Its findings were consistent with earlier results based on mtDNA and Y-chromosomal DNA that support the theory that modern Iberians (Spanish and Portuguese) hold the most ancient European genetic ancestry, as well as ...

The majority of studies of genetic association with disease have been performed in Europeans. This European bias has important implications for risk prediction of diseases across global populations. In this commentary, we justify the need to study more diverse populations using both empirical examples and theoretical reasoning.

The Missing Diversity in Human Genetic Studies: Cell

Main Text. It has been well documented

that genetic studies of human disease, especially large-scale ones, have not captured the level of diversity that exists globally, as they are predominantly based on populations of European ancestry (Popejoy and Fullerton, 2016). The results showed high genetic diversity in all populations, with an average expected heterozygosity of 0.610, and the northern-most populations (Dailin (DL) and Fenglin (FL)) showed slightly higher diversity than the other five populations. The level of genetic differentiation among populations was very low ($F_{ST} = 0.020$).

The impact of forest management on genetic diversity and mating was examined in European beech (*Fagus sylvatica*L.). Ten beech stands located in Europe were studied in pair-wise plots, differing in management intensity. The stands were genotyped with four highly polymorphic microsatellite loci. Human genetic diversity in southern Europe is higher than in other regions of the continent. This difference has been attributed to postglacial expansions, the demic diffusion of agriculture from the Near East, and gene flow from Africa. Genetic diversity is the total number of genetic characteristics in the genetic makeup of a species, it ranges widely

from the number of species to differences within species and can be attributed to the span of survival for a species. It is distinguished from genetic variability, which describes the tendency of genetic characteristics to vary. Genetic diversity serves as a way for populations to adapt to changing environments.
