Answer: E. This is another boundary behavior question with a mathematical slant to it. The frequency of the incident and transmitted waves are always the same. Thus, use $f = v/w$ to find the frequency of the incident wave - 2.2 Hz. The frequency of the transmitted wave is also 2.2 Hz, the wavelength is 3.0 m, and so the speed is $f \cdot w = 6.6 \text{ m/s}$.

A wave is a disturbance that moves along a medium from one end to the other. If one watches an ocean wave moving along the medium (the ocean water), one can observe that the crest of the wave is moving from one location to another over a given interval of time. The crest is observed to cover distance.

Answer: 70.6 Hz. For an open-end air column, the wavelength of the fundamental's standing wave pattern is two times the length of the air column; this relationship is depicted in the diagram at the right. So the wavelength of the wave is 4.90 m. The speed of the sound wave in air is dependent upon temperature.

Assuming negligible air resistance, the kinetic energy of the diver upon hitting the water is equal to the potential energy of the diver on top of the board. $PE_i = KE_f$. $m \cdot g \cdot h_i = KE_f$. Substituting 500 N for $m \cdot g$ (500 N is the weight of the diver, not the mass) and 10 m for h will yield the answer of 5000 J.
