Machine Learning Challenges Evaluating Predictive ...
 Within predictive maintenance, there are two basic applications

of ML—anomaly detection and classification. Anomaly detection is based on unsupervised machine learning (doesn't rely on humans to interpret the data), while classification uses supervised models, which require some form of human feedback to train the algorithm, for example, connecting the failure pattern with the underlying failure mode.

Abstract. This Chapter presents the PASCAL Evaluating Predictive Uncertainty Challenge, introduces the contributed Chapters by the participants who obtained outstanding results, and provides a discussion with some lessons to be learnt. The Challenge was set up to evaluate the ability of Machine Learning algorithms to provide good “probabilistic predictions”, rather than just the usual “point predictions” with no measure of uncertainty, in regression and classification problems.

Predictive analytics is driven by predictive modelling. It’s more of an approach than a process. Predictive analytics and machine learning go hand-in-hand, as predictive models typically include a machine learning algorithm. These models can be trained over time to respond to new data or values, delivering the results the business needs.
