Remapping Of Place Cell Firing

Place cells have the ability to suddenly change their firing pattern from one pattern to another, a phenomenon known as remapping. This remapping may occur in either some of the place cells, or in all place cells at once. It may be caused by a number of changes, such as a change in the odor of the environment.

Place cell - Wikipedia

When place cells are recorded from rats running on an elevated T-maze inside a curtained enclosure that contains distinct, experimenter selected stimuli, rotations of the maze plus stimuli cause equal rotations of firing fields. Here, we examined the effects of conflicting rotations of a T-maze relative to a laboratory frame that contained a large number of fixed stimuli in the environment and ...

By contrast, when there is only a slight change in an environment, hippocampal place cells show changes in their firing rates, while keeping the position of firing field constant (rate remapping) (Leutgeb et al., 2005a, 2007). Although it is likely that both global remapping and rate remapping are needed for high-precision spatial memory, the disruption in global remapping would completely deprive AD patients of spatial information about which environment they are currently occupying.

Department of Clinical Neurobiology, German Cancer Research Center (DKFZ), Medical Faculty of Heidelberg University, Heidelberg University, Heidelberg, Germany. The activity of hippocampal cell ensembles is an accurate predictor of the position of an animal in its surrounding space. One key property of hippocampal cell ensembles is their ability to change in response to alterations in the surrounding environment, a phenomenon called remapping.

Place cell remapping was initially conceptualized as being a sudden transition of the place cell network from one state to the next following the large perturbation arising from environmental change , an idea that has been very influential.

REMAPPING AND MEMORY One of the events that pointed to place cells as an expression of declarative memory was the discovery of remapping, or the fact that any place cell is part of not one, but many independent representations.

Place Cells, Grid Cells, and Memory

Second, global remapping would predict that many cells stopped firing completely in one running direction; however, even during rate remapping the changes in rate can be sufficient to cause a few cells to have firing probabilities that approach zero in a given location in one or other condition (Leutgeb et al., 2005). Forty-eight fields (25 percent) ended with no spikes in at least one running direction.

Ignoring specific contexts and focusing only on the number of conditions in which a cell could potentially fire and what remapping patterns it could show between these conditions, 11 remapping profiles are possible: (1) a cell that fires in one condition only (which we will call profile A); (2) a cell that fires in two conditions only, where the fields could be the same or different (profiles B1 and B2, respectively); (3) a cell that fires in three conditions only, where the fields could be ...
