In epidemiology, a disease vector is any agent which carries and transmits an infectious pathogen into another living organism; agents regarded as vectors are organisms, such as intermediate parasites or microbes. The first major discovery of a disease vector came from Ronald Ross on 20 August 1897. Sir Ronald

Ross discovered the Malaria pathogen when he dissected a mosquito.

Vector (epidemiology) - Wikipedia

The triad consists of an external agent, a susceptible host, and an environment that brings the host and agent together. In this model, disease results from the interaction between the agent and the susceptible host in an environment that supports transmission of the agent from a source to that host. Two ways of depicting this model are shown in Figure 1.16. Agent, host, and environmental factors interrelate in a variety of complex ways to produce disease.

Principles of Epidemiology | Lesson 1 - Section 8

The most important barriers to invasion of the human host by infectious agents are the skin and mucous membranes (the tissues that line the nose, mouth, and upper respiratory tract). When these tissues have been broken or affected by earlier disease, invasion by infectious agents may occur.

If host resistance is too high, or too low, the disease will die out: in the former case, because the infective agent is unable to maintain itself and, in the latter, because it eliminates the host. One of the best-known illustrations of the importance of relative host resistance to survival of the parasite is that of the plague bacillus (*Yersinia pestis*).
