Finding Real Solutions Of Polynomial

The first step in finding the solutions of (that is, the x-intercepts of, plus any complex-valued roots of) a given polynomial function is to apply the Rational Roots Test to the polynomial's leading coefficient and constant term, in order to get a list of values that might possibly be solutions to the related polynomial equation. Your hand-in work is probably expected to contain this list, so write this out neatly.

Since the polynomial has a degree of 3 (x^3), it has three solutions. If you have to 'do it by hand', you can always find the 'possible' real answers by looking at the factors of the coefficients that make up the high order term and the lowest order term. Since the high order temr is one, the possible real answers will be +_ 1,2,3,4,6,8,12,24.

How many real solution(s) does the polynomial have?

If a polynomial has real coefficients, then either all roots are real or there are an even number of non-real complex roots, in conjugate pairs. For example, if $5+2i$ is a zero of a polynomial with real coefficients, then $5-2i$ must also be a zero of that polynomial. It is equally true that if $(x-5-2i)$ is a factor then $(x-5+2i)$ is also a factor.

How to Find the Real Roots of a Polynomial Using Descartes’s Rule of Signs By Yang Kuang, Elleyne Kase If you know how many total roots a polynomial has, you can use a pretty cool theorem called Descartes’s rule of signs to count how many roots are real numbers (both positive and negative) and how many are imaginary.

How to Find the Real Roots of a Polynomial Using Descartes ...

Solution: Let the given polynomial be, $p(x) = 3x^3 + 5x^2 + 6x + 4$. Substituting $x = -2$, $p(-2) = 3(-2)^3 + 5(-2)^2 + 6(-2) + 4$. $p(-2) = -24 + 20 - 12 + 4 = -12$. Here, $p(-2) \neq 0$. Therefore, -2 is not a root of the polynomial $3x^3 + 5x^2 + 6x + 4$. Example 2: Find the roots of the polynomial $x^2 + 2x - 15$. Solution: Given $x^2 + 2x - 15$. By splitting the middle term,

Roots of Polynomials - Definition, Formula, Solution ...

First, find the real roots. And let's sort of remind ourselves what roots are. So root is the same thing as a zero, and they're the x-values that make the polynomial equal to zero. So the real roots are the x-values where p of x is equal to zero.

$2x+1$ is a linear polynomial: The graph of $y = 2x+1$ is a straight line. It is linear so there is one root. Use Algebra to solve: A "root" is when y is zero: $2x+1 = 0$. Subtract 1 from both sides: $2x = -1$. Divide both sides by 2: $x = -1/2$. And that is the solution: $x = -1/2$ (You can also see this on the graph)
