In single-stage molding, overall heat is controlled by holding and

cooling time while a change in injection speed can be used to change the temperature in the preform. Haze develops when PET in either injection or blow stages is heated beyond about 115°C (240°F) and allowed to cool down for even a short time. At this temperature, PET molecules have enough freedom to form crystals, and that is precisely what they will do because it allows for a lower energy state.
