I would like some help with Sadiku's exercise about second order circuits. I did'nt understand why the solution says that V (0) = -30 V. Also, I did not understand why the capacitor's voltage (Vc) is -30 V. Isn't the voltage for t <0 (when the capacitor is loaded) the same as the voltage source? The exercise asked i(t) for t>0 .

Getting a unique solution to a second-order differential equation requires knowing the initial states of the circuit. For a second-order circuit, you need to know the initial capacitor voltage and the initial inductor current. Knowing these states at time t = 0 provides you with a unique solution for all time after time t = 0.
