Effects Of Temperature On Ectothermic

The study of thermoregulation in endotherms has contributed much to the emergence of the concept of control theory in biology. By the same token, the study of temperature adjustment in ectotherms is likely to have a far-reaching influence on ideas on the regulation of metabolism in general. The reason for this is that ectotherms, in adapting to the vagaries of a thermally unstable environment, deploy a range of subtle molecular and organismic strategies.

For processes governed by aerobic respiration, such as growth and development of most ectothermic animals, E_a is typically approximately 0.65 eV (corresponding to a Q_{10} of approx. 2.5 or a 2.5-fold increase in development rate for a 10°C increase in temperature). The effect of temperature on body size at maturity, however, depends on how energy and materials are allocated during ontogeny.

Rising temperatures cause increases in O₂ consumption (Q₁₀ effect) and decreases in the O₂ affinity of hemoglobin (a rightward shift in the oxygen-hemoglobin dissociation curve). These changes in air-breathing ectotherms are not proportional, i.e., the increased ventilation is relatively smaller than the change in metabolic rate.

Temperature imposes significant constraints on ectothermic animals, and these organisms have evolved numerous

adaptations to respond to these constraints. While the impacts of temperature on the physiology of ectotherms have been extensively studied, there are currently no frameworks available that outline the multiple and often simultaneous pathways by which temperature can affect behaviour.

The physiological processes of many organisms are sensitive to temperature. In order to see this effect of temperature, we examined the heart rate of a *Daphnia magna* over a range of different temperatures. Being an ectothermic animal, the *Daphnia*'s body temperature is dependent on water temperature. It was hypothesized that since most physiological processes are faster at higher temperatures, the *Daphnia*'s heart rate will be faster at higher temperatures and slower at low temperatures.

effects of temperature on ectotherms? why does temperature affect the heart rate of ectotherms? i know that ectotherms rely on the environment for their heat and internal body temperature; when its hotter their metabolic rate increases and when its colder it decreases. but heart rate and metabolic rate are different right? so why exactly does it affect heart rate?

The ectothermic qualities of *Daphnia* explained the effects of temperature on the animal. (Campbell, 2005) *Daphnia* was more tolerant to lower temperatures than to higher temperatures. This was expected since *Daphnia* usually lives in cold water. (LaFave, 2003b) The alcohol affected *Daphnia* as expected.
