ANOVA, REML allows for changing variances, so can be used in experiments where some treatments (for example different spacings, crops growing over time, treatments that include a control) have a changing variance structure. The statistical package GenStat is used throughout. The current version is 13, although the analyses can generally be performed using the Discovery Edition released in 2010.

ANOVA & REML - StATS

Analysis of variance by ANOVA, regression or REML assesses a data set to select the most appropriate method for analysis of variance. If the design is orthogonal or balanced it uses the analysis of variance facilities. Otherwise, if there is no blocking in the design (i.e. there is only one random term) it uses the Genstat regression facilities. Finally, if there are additional random terms, it looks to see if these contain any useful

How do I report the results of a linear mixed models analysis?

Assuming that statistical observations follow Normal distribution, there are two parameters: μ (mean) and σ^2 (variance) to estimate if one wants to summarize the observations. It turns out that the variance estimator given by Maximum Likelihood (ML) is biased , i.e. the value we obtain from the ML model over- or under-estimates the true variance , see the figure below.

Restricted maximum likelihood. In statistics, the restricted (or residual, or reduced) maximum likelihood (REML) approach is a particular form of maximum likelihood estimation that does not base estimates on a maximum likelihood fit of all the information, but instead uses a likelihood function calculated from a transformed set of data, so that nuisance parameters have no effect.

ANOVA by Restricted Maximum Likelihood (REML) ¶. The ANOVA is where the descriptive statistics and statistical tests are presented. In general, look for low p-values to identify important

terms in the model. Select View > Annotated ANOVA to see the blue annotation text to help interpret the key elements in the ANOVA report.

Usually, you use Restricted maximum likelihood (REML) because the variance component estimator from REML is approximately unbiased, while the maximum likelihood estimator is biased. However, the bias gets smaller for larger sample sizes.

The model statistics are shown by clicking on the ANOVA (REML) tab. You will get a warning that the model you have selected is not hierarchical. Be sure to click Yes to correct for hierarchy. This will give you a more statistically sound model, ensuring lower order terms (in this case b) are present to support higher order

terms (like ab), even if they are insignificant.

Yes, adding the METHOD=TYPE3 option to the PROC MIXED statement is the key to getting an ANOVA table from the MIXED procedure. It should be noted that doing so results in moment estimates of the parameters of the model. The moment estimators and the REML estimators may be identical for some balanced designs.
