Adding Strong Acids or Bases to Buffer Solutions. Now that we have this nice F-/HF buffer, let's see what happens when we add strong acid or base to it. Recall that the amount of F⁻ in the solution is $0.66\text{M} \times 0.1\text{ L} = 0.066\text{ moles}$ and the amount of HF is $1.0\text{ M} \times 0.1\text{L} = 0.10\text{ moles}$. Let's double check the pH using the Henderson-Hasselbalch Approximation, but using moles instead of concentrations:

In this laboratory, students investigate the properties of buffer solutions. The students make two ideal buffer solutions, one consisting of a weak acid and its conjugate base and the other, a weak base and its conjugate acid. The initial pH of each solution is determined. Strong acid and strong base are then added to each buffer in a series of steps, with the pH determined after each addition.

A buffering agent is a weak acid or base used to maintain the acidity of a solution near a chosen value after the addition of another acid or base. That is, the function of a buffering agent is to prevent a rapid change in pH when acids or bases are added to the solution. Buffering agents have variable properties—some are more soluble than others; some are acidic while others are basic.
