Remark 2.1. We will refer to the triple $(\Omega, \mathcal{F}, \mu)$ as a measure space. If $\mu(\Omega) = 1$ we refer to it as a probability space and often write this as $(\Omega, \mathcal{F}, P)$. Example 2.1. Let Ω be a countable set and let $\mathcal{F}$ = collection of all subsets of Ω . Denote by $\#A$ denote the number of point in A . Define $\mu(A) = \#A$. This is called the counting measure.

1.3 An example of using probability theory Probability theory deals with random events and their probabilities. A classical example of a random event is a coin tossing. The outcome of each tossing may be heads or tails: H or T . If the coin is fair then after N trials, H occurs approximately $N/2$ times, and so does T . It is natural to believe that if $N \rightarrow \infty$...

Measure Theory together with X from an additive system on which μ is additive but not completely additive if $\mu(X) = 2$. A non-negative, completely additive function μ defined on a Borel system $\mathcal{S}$ of subsets of a set X is called a measure. It is bounded (or finite) if $\mu(X) < \infty$. It is called a probability measure if $\mu(X) = 1$.

The field is at the intersection of probability theory, statistics, computer science, statistical mechanics, information engineering, and electrical engineering. A key measure in information theory is entropy. Entropy quantifies the amount of uncertainty involved in the value of a random variable or the outcome of a random process.

Information theory - Wikipedia

In probability theory and related fields, a stochastic or random process is a mathematical object usually defined as a family of random variables. Many stochastic processes can be represented by time series. However, a stochastic process is by nature continuous while a time series is a set of observations indexed by integers.
