G's felt + G's + 1. $2.5 = g + 1$, $g = 1.5$. $G's = A_{centripetal} / 9.8$. $A_{centripetal} = 1.5 * 9.8 = 14.7$. $Radius = v^2 / A_{centripetal} = 27.42^2 / 14.7 = 51.14m$ or 167.78 feet. The kinetic energy at the bottom of the drop determines how far the coaster train can travel along the track and through inversions, banked turns and airtime hills. The calculation between the lift hill and the drop heights have to be precise, otherwise the train will not gather enough potential and kinetic energy to complete the circuit.

The kinetic energy of the roller coaster is: where v is the speed of the roller coaster. If we assume no friction losses, then energy is conserved. Therefore, Thus, mass cancels out, and This result is nice because it allows us to approximate the speed of the roller coaster knowing only the vertical height h that it fell (on any part of the track). Of course, due to friction losses the speed will be a bit less than this, but it is very useful nonetheless.
