Example Prove that e^x is represented by its Maclaurin series on the interval $(-1, 1)$. Solution: Let $f(x) = e^x$. Take any open interval of the form $I = (-A, A)$, where $A > 0$. Then for all t in I and for all k , $|f^{(k)}(t)| = |e^t| = e^t < e^A$. By our Corollary, the Maclaurin series

of e^x converges to e^x on the interval $(-A, A)$. Since $A > 0$ is arbitrary, the Maclaurin series of e^x converges to e^x at all points x .

Differential equations - Taylor's method

Taylor series are used to define functions and "operators" in diverse areas of mathematics. In particular, this is true in areas where the classical definitions of functions break down. For example, using Taylor series, one may extend analytic functions to sets of matrices and operators, such as the matrix exponential or matrix logarithm.

Taylor series - Wikipedia

In Mathematics, the Taylor series is the most famous series that is utilized in several mathematical as well as practical problems. The Taylor theorem expresses a function in the form of the sum of infinite terms. These terms are determined from the derivative of a given function for a particular point. The standard definition of an algebraic function is provided using an algebraic equation.
