Reactive power (VAR) compensation is defined as the management of reactive power to improve the performance of ac systems. There are two aspects:- a) Load Compensation - The main objectives are to :- (i) increase the power factor of the

system (ii) to balance the real power drawn from the system (iii) compensate voltage regulation (iv) to eliminate current harmonics.

Reactive Power Compensation - Electrical idea

Reactive power compensation of distribution network is an important method to improve power quality and voltage stability, while reducing the power loss of the distribution network. In this paper the objective function is built to minimize all the costs which include power loss costs and investment of the dynamic reactive power compensation device divided into each year.

This reactive power should be properly compensated otherwise, the ratio of actual power consumed by the load, to the total power i.e. vector sum of active and reactive power, of the system becomes quite less. This ratio is alternatively known as the electrical power factor, and a lower ratio indicates a poor power factor of the

system.
