The mathematical issue here is the assignment of some quantitative measure of "power" in situations where people, voting yes or no on a measure, do not necessarily have one

vote each. For a simple example, suppose that there are three voters (call them A, B and C) with 3, 2 and 1 votes, respectively; to pass a measure, 4 “yes” votes are necessary.

The Mathematics of Voting

Formally, if $T(C)$ denotes the set of total orderings of C then a voting system is a function

$f: T(C)^n \rightarrow T(C)$, where n is the number of voters. In the case of two candidates, May's theorem (1952) provides some good news. Consider a voting system that satisfies the following sensible conditions:
