The condenser bushing is made by inserting very fine layers of metallic foil into the paper during the winding process. The inserted conductive foils produce a capacitive effect which dissipates the electrical energy more evenly throughout the insulated paper and reduces the electric field stress between the energised conductor and any earthed material.

Condenser bushings provide greater dielectric strength and uniform voltage gradient. These bushings form a capacitor between the live conductor and the equipment body which is at ground potential.

High-Voltage Bushing Maintenance and Testing Explained

Type T™ bushings are a versatile condenser type design. Designs are available for both vertical and horizontal mounting as well as high temperature applications. The high temperature design is thermally enhanced to operate properly when the bushing is applied inside of the high temperature environment of non-ventilated bus duct.

Compared to bulk type bushings, condenser bushings are relatively complex in their construction. In order to cope with the high electric field stresses generated at high voltage, condenser bushings are formed from an inner capacitance-graded insulated core, which is sandwiched between the central current carrying tube and external insulator.
