Background. Coolant and refrigerants are found throughout the industrialized world, in homes, offices, and factories, in

devices such as refrigerators, air conditioners, central air conditioning systems (HVAC), freezers, and dehumidifiers. When these units are serviced, there is a risk that refrigerant gas will be vented into the atmosphere, hence the creation of technician training and certification programs in order to ensure that the material is conserved and managed safely.

Refrigerant reclamation - Wikipedia

A refrigerant is a substance or mixture, usually a fluid, used in a heat pump and refrigeration cycle. In most cycles it undergoes phase transitions from a liquid to a gas and back again. Many working fluids have been used for such purposes. Fluorocarbons, especially chlorofluorocarbons, became

commonplace in the 20th century, but they are being phased out because of their ozone depletion effects. Other common refrigerants used in various applications are ammonia, sulfur dioxide, and non-halogen

Refrigerant - Wikipedia

The specific refrigerant charge varies between 0.055 kg/kW and 0.46 kg/kW of nominal cooling capacity, so chiller selection is clearly an effective way of minimising the quantity of ammonia used and the consequential hazards of accidental release. A crucial feature of ammonia discharges is the ambient density of the released refrigerant.
