Creatine kinase, also known as creatine phosphokinase or phosphocreatine kinase, is an enzyme expressed by various tissues and cell types. CK catalyses the conversion of creatine and uses adenosine triphosphate to create phosphocreatine and adenosine diphosphate. This CK enzyme reaction is reversible and thus ATP can be generated from PCr and ADP. In tissues and cells that consume ATP rapidly, especially skeletal muscle, but also brain, photoreceptor cells of the retina, hair cells of the inner

CLINICAL SIGNIFICANCE Creatine kinase (CK) is a dimeric enzyme composed of two types of monomer sub-units, M (Muscular) and B (Brain) which combine to form three distinct CK isoenzymes, CK-1 (BB), CK-2 (MB) and CK-3 (MM). The main proportion of total CK activity is found in the skeletal muscle and this is predominantly the CK-3 isoform.

Creatine kinase (CK) is an enzyme that catalyzes the reversible phosphorylation of creatine (Cr) by adenosine triphosphate (ATP). Physiologically, when muscle contracts, ATP is converted to adenosine diphosphate (ADP), and CK catalyzes the rephosphorylation of ADP to ATP using creatine phosphate as the phosphorylation reservoir.
