X-rays are produced by high-energy electrons bombarding a target, especially targets that have a high proton number (Z). When bombarding electrons penetrate into the target, some electrons travel close to the nucleus due to the attraction of its positive charge and are subsequently influenced by its electric field.

Bremsstrahlung | Radiology Reference Article | Radiopaedia.org

Ionizing radiation is made up of energetic subatomic particles, ions or atoms moving at high speeds (usually

greater than 1% of the speed of light), and electromagnetic waves on the high-energy end of the electromagnetic spectrum.

Ionizing radiation - Wikipedia

Bremsstrahlung /'brɛmfʃtrɑ:lən/, from bremsen "to brake" and Strahlung "radiation"; i.e., "braking radiation" or "deceleration radiation", is electromagnetic radiation produced by the deceleration of a charged particle when deflected by another charged particle, typically an electron by an atomic nucleus. The moving particle loses kinetic energy, which is converted into radiation, thus satisfying the law of conservation of energy. The term is also used to refer to the process of ...

Bremsstrahlung - Wikipedia

On the other hand, high energy electrons hitting matter do emit their energy as photons, called x-rays but indistinguishable from gamma rays. They do not cease to exist, but they do stop in the electrode and are absorbed by electrode, becoming indistinguishable from the electrons that already were in Fermi sea. Sep 1, 2016 #5

Electrons are locally heated to extremely high energies within the Van Allen Radiation Belts, new study finds. The Earth's magnetic field is trapping high energy particles. When the first satellites were launched into space, scientists led by James Van Allen unexpectedly
