Complexity Reduction In Hevc Intra

A deep convolutional neural network approach for complexity reduction on intra-mode HEVC. Abstract: The High Efficiency Video Coding (HEVC) standard significantly saves coding bit-rate over the proceeding H.264 standard, but at the expense of extremely high encoding complexity. In fact, the coding tree unit (CTU) partition consumes a large proportion of HEVC encoding complexity, due to the brute-force search for rate-distortion optimization (RDO).

As HEVC is tremendously complex , several approaches can be found in the literature that try to reduce this complexity. For instance, early skip and early CU conditions [18] , [19] , finally adopted by the HM reference software [3] , try to reduce the number of iterations by applying inter prediction.

Reducing Complexity of HEVC: A Deep Learning Approach

3D-HEVC is an emerging coding standard for the compression of multi-view video plus depth data. In 3D-HEVC, Depth Modeling Modes (DMMs) searching and coding unit (CU) partition consume a large proportion of the 3D-HEVC encoding complexity. This paper proposes techniques to speed up 3D-HEVC depth intra mode decision and early terminated depth CU partition.

The proposed approach of complexity reduction targets CUs of size 16 16 and larger only. By terminating CUs of size at least 16 16, only a reduced number of CUs of size 8 8 will be left.

However, the computational complexity of the typical HEVC encoder dramatically increases because of the recursive searching scheme for finding the best coding unit (CU) partitions.
