Thermally-induced strains in the particle simulation model can be considered by modifying the force carried by each contact bond, so as to account for heating of particles.

The thermal component of the thermo-mechanical coupling particle model can be used to simulate not only transient heat conduction and storage, but also thermally-induced displacements and forces in the rock mass.

The resulting FE simulation is used to predict the thermomechanically induced material response, while the GP simulation provides the appropriate boundary conditions. The hybrid simulation system is able to provide a detailed analysis of the transient in-process state of the workpiece, which forms the basis
