Fig. 8 shows the change of shell-side mass flow rate with respect to the amount of heat transfer and shell-side pressure drop. As can be seen from Fig. 8 increasing the shell-side mass flow rate, increased the heat transfer between the shell-side and tube side fluid, and the pressure drop between the inlet and outlet of the shell-side. When the shell-side mass

flow rate increases 28 to 138 kg/s, the heat transfer increases 7.61–29.8 MW whereas the shell-side pressure drops 2.00–49.4 MPa.

To simplify numerical simulation while and keep the basic characteristics of the process, following assumptions are made:

(1) constant thermal properties are maintained for the shell-side fluid; (2) the heat transfer processes and fluid flow are in steady-state and turbulent; (3) the leak flows between baffle and tube and that between baffle and the shell are neglected; (4) Neglect the natural convection induced by the fluid density variation.;
