Introduction High resolution X-ray diffractometry and topography are now widely accepted techniques for the study of small strains in highly perfect crystals. They differ in that diffractometry ex-amines, as a function Of angle, the variation of the total scattered intensity from the area of sample illuminated by the X-ray beam (which may itself be conditioned by one or more Bragg reflection optical components).

High-Resolution Diffractometers. Powder neutron diffractometers are very large in comparison to laboratory X-ray instruments as shown by the scale in the figure below, which shows the layout of the high-resolution powder neutron diffractometer D2B at the ILL. The term high-resolution refers not to the smallest peak width in the powder diffraction pattern, but to the fact that the instrumental resolution function results in narrow peaks at high

scattering angle.
