Abstract Uranium deposits in the South Texas Uranium Region are classical roll-type deposits that formed at the margin of tongues of altered sandstone by the encroachment of oxidizing, uraniferous solutions into reduced

The tectonic movements during the middle Jurassic – early Cretaceous in the Ordos Basin disturbed the sedimentation, its strong uplift promoted migration of oil-natural gases upwards providing a redox regime for uranium accumulation and formed large sandstone-type U deposits, such as Dongsheng and Diaotou (Yang et al., 2009). Faults are also important for uranium mineralization in sedimentary rocks, because they act as hydrodynamic

discharge zones and as geochemical redox barriers for ...

### **Sandstone type uranium deposits in the Ordos Basin ...**

Sandstone-type uranium deposits of the Colorado Plateau are epigenetic. Certain elements have been added locally to the sandstone host to form the deposits; the added fraction of each element in the deposits is called extrinsic to distinguish it from the part present in the original unmineralized host.

Consequently, it is not certain how important adsorption is to the formation of reduced uranium minerals. The strong association of organic matter with uranium deposits in sedimentary rocks and the change in the character of the deposits from physical to chemical concentrations concomitant with the change in the oxidation

state of the atmosphere indicate that reduction is the most important chemical process involving organic matter in the genesis of uranium deposits.

A large amount of uranium is in rare earth deposits, and may be extracted as a by-product. Higher uranium prices and geopolitical developments would enhance the economic potential for recovering these. Rare earths are essential for many modern technologies. Growth in electric car use will depend, in part, on the the availability of rare earths.

## **STRATIGRAPHIC CONTROL OF SANDSTONE URANIUM DEPOSITS IN ...**

Abstract. Sandstone uranium deposits represent uranium concentrations formed by low-temperature hydrothermal processes, usually of diagenetic to epigenetic origin. The deposits are commonly hosted in arkosic sandstone and are therefore referred to as sandstone-type uranium. Globally, this is the most abundant type of uranium mineralisation, containing approximately 28% of

the world's uranium deposits with resources  
resources and exceeding 100 kt of  
including several giant uranium.
