The topic “gas discharge physics” is fundamental to electrical breakdown in gases. Many excellent publications provide detailed accounts. In this article, the authors recall contributions drawn from research conducted at the University of Strathclyde (UK) under the direction of David J. Tedford. From the late 1950s onwards, these programmes generated numerous international meetings, research collaborations and exchange programmes that inevitably fostered several lively “debates”.

A gas discharge is a kind of plasma. It is an ionised gas consisting of equal concentrations of positive and negative charges and a large number of neutral species. In the simplest case, it is formed by applying a potential difference (of a few 100 V to a few kV) between two electrodes that are inserted in a cell or reactor (or that form the reactor walls).

Electric discharge in gases occurs when electric current flows through a gaseous medium due to ionization of the gas. Depending on several factors, the discharge may radiate visible light. The properties of electric discharges in gases are studied in connection with design of lighting sources and in the design of high voltage electrical equipment.

A gas-filled tube, also known as a discharge tube, is an arrangement of electrodes in a gas within an insulating, temperature-resistant envelope. Gas-filled tubes exploit phenomena related to electric discharge in gases, and operate by ionizing the gas with an applied voltage sufficient to cause electrical conduction by the underlying phenomena of the Townsend discharge. A gas-discharge lamp is an electric light using a gas-filled tube; these include fluorescent lamps, metal-halide lamps, sodium
