A thin film is a layer of material ranging from fractions of a nanometer to several micrometers in thickness. The controlled synthesis of materials as thin films (a process referred to as deposition) is a fundamental step in many applications. A familiar example is the household mirror, which typically has a thin metal coating on the back of a sheet of glass to form a reflective interface.

Film weights range from 50-400 g/m 2 and are available either supported by a carrier that aids film placement and resin flow, or in unsupported form, which can be used for the reticulation process in core-to-faceskin bonding (reticulation occurs when film adhesive is placed over a honeycomb core in a specialized press, then heated. This subjects the film to gas pressure, which creates bubbles ...
