A Real Time Embedded System is a type of computer system with timing constraints i.e. a system which responds to external events or input stimuli in a timely fashion (within finite and specified time). Here, Timing Constrains include Response Time, Start Time and Finish Time i.e. time taken to respond to the event, time at which the response to ...

Embedded System and Its Real Time Applications

An embedded system is a computer system designed to perform one or a few dedicated functions often with real time computing constraints. It is embedded as part of a complete device often including hardware and mechanical parts. By contrast, a general-purpose computer, such as a personal computer (PC), is designed to be flexible and to meet a wide range of end-user needs.

Tutorial : What Is Embedded And Real Time Systems

A real-time computer system may be a component of a larger system in which it is embedded; reasonably, such a computer component is called an embedded system. Applications and examples of real-time systems are ubiquitous and proliferating, appearing as part of our commercial, government, military, medical, educational, and cultural infrastructures.

What Are Real-Time Embedded Systems

An even more significant development in the world of real-time embedded systems design was the Motorola 68000 series whose instruction set allowed the easy partitioning of user and system stacks. This new instruction set also introduced a rich orthogonal set of set of pointer based address modes across what had grown to five 16 bit base ...
