Dynamic Energy Management of a Microgrid Using Approximate Dynamic Programming and Deep Recurrent Neural Network Learning.

Abstract: This paper focuses on economical operation of a microgrid (MG) in real-time. A novel dynamic energy management system is developed to incorporate efficient management of energy storage system into MG real-time dispatch while considering power flow constraints and uncertainties in load, renewable generation and real-time electricity price.

Dynamic Energy Management of a Microgrid Using Approximate ...

Dynamic programming is both a mathematical optimization method

and a computer programming method. The method was developed by Richard Bellman in the 1950s and has found applications in numerous fields, from aerospace engineering to economics. In both contexts it refers to simplifying a complicated problem by breaking it down into simpler sub-problems in a recursive manner. While some decision problems cannot be taken apart this way, decisions that span several points in time do often break apart

Dynamic programming - Wikipedia

Abstract: This paper proposes an approximate dynamic programming (ADP)-based approach for the

economic dispatch (ED) of microgrid with distributed generations. The time-variant renewable generation, electricity price, and the power demand are considered as stochastic variables in this paper. An ADP based ED (ADPED) algorithm is proposed to optimally operate the microgrid under these uncertainties.

dynamic programming (ADP). We propose an approximate policy iteration (API) algorithm (Bertsekas and Tsitsiklis 1996, Powell 2007, Bertsekas 2011), which can accommodate the nonlinear structure of the terminal value function. API is a broad class of ADP methods that use iterative simulations to learn the dynamic programming value functions.
