12-co-ordination. Most metals are close packed - that is, they fit as many atoms as possible into the available volume. Each atom in the structure has 12 touching neighbours. Such a metal is described as 12-co-ordinated. Each atom has 6 other atoms touching it in each layer. There are also 3 atoms touching any particular atom in the layer above and another 3 in the layer underneath.

The Structure of Metals and Other Monatomic Solids . The structures of pure metals are easy to describe because the atoms that form these metals can be thought of as identical perfect spheres. The same can be said about the structure of the rare gases (He, Ne, Ar, and so on) at very low temperatures.

The Structure of Metals

The three most common crystalline structures in metal are face-centered cubic, body-centered cubic and hexagonal close-packed. Face-centered Cubic. One of the most common crystalline structures is face-centered cubic (FCC). The FCC crystalline structure gets its name from its cube shape and the locations of the atoms within that cube.

Sodium metal crystallizes in the body-centered cubic structure, in which each atom has eight nearest neighbors. Since the electronic configuration of Na is [Ar]3s 1, there are only two valence electrons per unit cell that are shared among eight Na-Na bonds.This means that the Na-Na bond order is 1/8 in Na metal.
