 C*-algebras are subjects of research in

functional analysis, a branch of mathematics. A C*-algebra is a Banach algebra together with an involution satisfying the properties of the adjoint. A particular case is that of a complex algebra A of continuous linear operators on a complex Hilbert space with two additional properties: A is a topologically closed set in the norm topology of operators. A is closed under the operation of taking adjoints of operators. Another important class of non ...

C*-algebra - Wikipedia
 This opened up the study of the algebraic isomorphism classes of such algebras, in the sense of emphasizing its cogency. It was soon found that C*-algebras have certain applications in quantum mechanics, and especially in

quantum field theory, in parts of group representation theory, and some other areas, in which W^* -algebras could not be substituted.

Algebra and Applications aims to publish well-written and carefully refereed monographs with up-to-date expositions of research in all fields of algebra, including its classical impact on commutative and noncommutative algebraic and differential geometry, K-theory and algebraic topology, and further applications in related domains, such as number theory, homotopy and (co)homology theory through to discrete mathematics and mathematical physics.

Algebra and Applications - Springer

This is a graduate-level introduction to C^* -algebras, Hilbert C^* -modules, vector bundles, and induced representations of groups and C^* -algebras, with applications to quantization theory, phase space localization, and

configuration space localization. The reader is supposed to know elementary functional analysis and quantum mechanics.

C J. L. Doran. Geometric Algebra and its Application to Mathematical Physics Ph.D. thesis, University of Cambridge (1994). Abstract: Clifford algebras have been studied for many years and their algebraic properties are well known. In particular, all Clifford algebras have been classified as matrix algebras over one of the three division algebras.

Geometric Algebra and its Applications in Mathematical Physics

The spectrum of a commutative C^* -algebra A coincides with the Gelfand dual of A (not to be confused with the dual A' of the Banach space A). In particular, suppose X is a compact Hausdorff space. Then there is a natural homeomorphism: $\cong C(X)$. This mapping is defined by $\phi \mapsto \{f \in C(X) : f(x) = \phi(x)\}$. $I(x)$ is a closed maximal ideal in $C(X)$ so is in fact primitive.. For details of the proof, see ...

C^* -approximation theory has provided the foundation for many of the most important conceptual breakthroughs and applications of operator algebras. This book systematically studies (most of) the numerous types of approximation properties that have been important in recent years: nuclearity, exactness,

quasidiagonality, local reflexivity, and others.

We study Jacobi-Zariski exact sequence for this theory in characteristic zero. In particular, we define (co)homology of relative $A \infty$ -algebras, i.e., $A \infty$ -algebras with a $C \infty$ -algebra playing the role of the ground ring. We also give a relation between the Hodge decomposition and homotopy Poisson-algebras cohomology.
