Solution. We can solve this problem using the multiplication principle. Let. $A = \{a_1, a_2, a_3, \dots, a_m\}$, $B = \{b_1, b_2, b_3, \dots,$

$b_n\}$. Note that to define a mapping from A to B, we have n options for $f(a_1)$, i.e., $f(a_1) \in B = \{b_1, b_2, b_3, \dots, b_n\}$. Similarly we have n options for $f(a_2)$, and so on.

Combinatorics has many applications in probability theory. You often want to find the probability of one particular event and you can use the equation. $P(X) = \frac{\text{probability that X happens} = \text{number of outcomes where X happens}}{\text{total number of possible outcomes}}$. You can use combinatorics to calculate the "total number of possible outcomes".

Combinatorics - Harvard University

Mathematicians who study combinatorics develop techniques to count outcomes, arrangements, and combinations of objects. These counting strategies can be applied to many different areas in mathematics, like probability, algebra, and geometry. Competitive combinatorics problems often present situations that appear overwhelming and chaotic at first.
