Analysis Of Diallel Mating Designs

The diallel mating design has been used successfully for over 50 years in plant breeding to estimate the relative combining ability of lines. From the diallel mating design, plant breeders can

estimate general combining ability (GCA) and specific combining ability (SCA). Sprague and Tatum (1942)

Proper analysis of the diallel mating design

One of the assumptions required to estimate genetic parameters by use of the diallel mating design is that the genes in the parents are independently distributed. The objective of this study was to test the validity of this assumption. Diallel experiments including a fixed sample and a random sample of parents were conducted in maize (*Zea mays* L.). For the fixed sample, an eight-parent diallel among selected inbred lines was produced (original diallel).

Analysis of Disconnected Diallel Mating Designs

The diallel mating design is of interest, in that the analysis of variance uses the concepts of general combining ability (GCA) and specific combining ability (SCA) to distinguish between the average performance of parents in crosses (GCA) and the deviation of individual crosses from the average of the parents (SCA).

Analysis of Half Diallel Mating Designs

Diallel mating design is used to evaluate several inbred lines in terms of combining ability variances and effects. Diallel cross refers to mating of selected parents in all possible combinations and evaluation of a set of diallel crosses is known as diallel analysis. Diallel is a Greek word and introduced by Schmidt in 1919.

Abstract The diallel mating designs have been extensively employed to gain genetic information by crop and tree breeders, but analysis of diallel data faces some challenges because the same parent acts both male and female roles. Theoretically, little attention was paid to the statistical inference and hypothesis testing for a fixed diallel linear model.

A diallel cross is a mating scheme used by plant and animal breeders, as well as geneticists, to investigate the genetic underpinnings of quantitative traits.. Abstract Diallel mating designs are generally used to obtain estimates of genetic effects for a fixed set of parental lines (fixed effects) or to estimate general combining ability (GCA) and specific combining ability (SCA) variance components from a set of randomly chosen parental lines (random effects) from multiple-environment experiments.
