- Optical fibers are widely used in Fiber-optic communications,

which permits transmission over longer distances and at higher bandwidths (data rates) than other forms of communication. • Fibers are used instead of metal wires because signals travel along them with less loss and are also immune to electromagnetic interference.

SVIT-10EC72

Fiber-optic communication is a method of transmitting information from one place to another by sending pulses of infrared light through an optical fiber. The light is a form of carrier wave that is modulated to carry information. Fiber is preferred over electrical cabling when high bandwidth, long distance, or immunity to electromagnetic interference is required.

Fiber-optic communication - Wikipedia

Optical Source Requirement for Performance (For Fiber Optics) • Physical dimensions to suit the optical fiber • Narrow radiation pattern (beam width) • Linearity (output light power proportional to driving current) • Ability to be directly modulated by varying driving current • Fast response time • Adequate output power into the fiber • Narrow spectral width (or line width)

An optical fiber (or fibre in British English) is a flexible,

transparent fiber made by drawing glass or plastic to a diameter slightly thicker than that of a human hair. Optical fibers are used most often as a means to transmit light between the two ends of the fiber and find wide usage in fiber-optic communications, where they permit transmission over longer distances and at higher ...
