Principal Component Analysis *Springer Science & Business Media*

Principal component analysis is probably the oldest and best known of the It was first introduced by Pearson (1901), techniques of multivariate analysis. and developed independently by Hotelling (1933). Like many multivariate methods, it was not widely used until the advent of electronic computers, but it is now well entrenched in virtually every

statistical computer package. The central idea of principal component analysis is to reduce the dimensionality of a data set in which there are a large number of interrelated variables, while retaining as much as possible of the variation present in the data set. This reduction is achieved by transforming to a new set of variables, the principal components, which are uncorrelated, and which are ordered so that the first few retain most of the variation present in all of the original variables. Computation of the principal components reduces to the solution of an eigenvalue-eigenvector problem for a positive-semidefinite symmetric matrix. Thus, the

definition and computation of principal components are straightforward but, as will be seen, this apparently simple technique has a wide variety of different applications, as well as a number of different derivations. Any feelings that principal component analysis is a narrow subject should soon be dispelled by the present book; indeed some quite broad topics which are related to principal component analysis receive no more than a brief mention in the final two chapters.

Atlas of Salivary Gland Pathology *Springer*

Surgical pathologists play a central role in patient surveillance and treatment by surgeons, radiation oncologists, and medical oncologists. Although salivary gland tumors are uncommon overall, their histopathologic diversity and challenge command the attention of practicing surgical pathologists. *Atlas of Salivary Gland Pathology* focuses on the diagnostic approach to salivary

gland neoplasia—one of the more challenging fields within surgical pathology—emphasizing the need to understand downstream implications with respect to patient surveillance and treatment. The presence of formidable histologic mimicry in salivary gland neoplasia is well-documented in the pathology literature and has also been observed in the consultation practice of the volume editor. This textbook is designed with the needs of practicing surgical pathologists and pathologists-in-training in mind, providing a comprehensive overview of both common and rare salivary gland

neoplasms. The primary educational objectives for readers include the following: 1) distinguish benign from low-grade malignant salivary gland neoplasms, 2) effectively use histochemical, immunohistochemical, and cytogenetic studies in challenging cases, 3) understand which diagnoses merit additional surgery and/or adjuvant therapy (radiation, chemotherapy), and 4) enhance pathologist-to-clinician communication in the setting of salivary gland disease.
